One replica, two replicas, or one bigger batch?

Same GPU, same questions, 4 → 32 users: 8 slots on one engine, 16 split across two, 16 on one engine

vLLM engine · the GPU · best result · the catch

Why: each engine's decode step reads ~17 GiB of weights once for its active batch.
One engine with 16 calls shares that read across all 16. Two engines repeat it and take turns.
