A replica dies under load

16 users, round robin. 60 s in, replica b's pod is deleted; Kubernetes brings it back ~130 s later.

gateway | healthy replica | dead replica / failures | after the fix

On one GPU, a second replica's clearest value is failover, not speed: 188 → 8 failed calls.

Failure counts exclude client hang-ups (499): 14 before, 13 after.
